At 4,411 m above sea level on the "roof of the world" (Tibet Qinghai plateau), Daocheng Yading is the highest civilian airport. Safe landings can be a challenge, with strong winds and turbulence common at higher altitudes. Most flights stop in winter, due to bad weather.

Air density decreases with altitude; this reduces the power output from an aircraft's engine and also requires a higher true airspeed to keep the aircraft airborne. Landings and takeoffs become particularly difficult.

General Rules

Landing Hot and High: Your engines will have to work extra hard to land! When placing a die in the Engines, reduce its value. You'll also need extra strong brakes (Ice Brakes), the Wind module, and an Intern.

Green (10)

Reduce Engine dice by 1 (no )s), but there's a side wind which might help you (Wind, starts sideways on 0). Your Intern should learn something today!

Yellow (7)

High altitude means thin air. Reduce Engine dice by 1 (no )s), there's a side wind which might help you (Wind, starts sideways on 0), but also Turbulence (track B). Seems your Intern picked the wrong day to quit smoking.

Red (7)

High altitude means thin air. Reduce Engine dice by 1 (no )s), unfortunately you're fighting a headwind (Wind, opposite direction on -3) and Turbulence (track B). Seems your Intern picked the wrong day to quit sniffing glue!

Black (6)

An unusually warm day means very thin air; reduce Engine dice by 2 (no )s or )s), you're fighting a headwind (Wind, opposite direction on -3) and Turbulence (track B). Your Intern may be looking for a new career after this!
